

RAMP ATMOSPHERIC CODES

The screenshot shows the RAMP website interface. At the top left is the RAMP logo, which includes the text "RADIATION PROTECTION CODE" and "ANALYSIS AND MAINTENANCE PROGRAM" around a central "RAMP" emblem. To the right of the logo, the text reads "United States Nuclear Regulatory Commission Radiation Protection Computer Code Analysis and Maintenance Program". Below this is a horizontal navigation menu with buttons for "Home", "RASCAL", "SNAP/RADTRAD", "HABIT", "VARSKIN", "GALE", "Radiological Toolbox", "PIMAL", "DandD", "GENII", "MILDOS", and "Atmospheric Codes". The "Atmospheric Codes" button is highlighted with a red circle, and a dropdown menu is open, listing "XOQDOQ", "PAVAN", and "ARCON96". On the left side of the page, there is a "RAMP Navigation" section with links to "Contact RAMP Administrators", "RAMP Member Registration", "RAMP Forum", "FAQs", and "RAMP Information Policy Paper". The main content area features the text "Welcome to the U.S. NRC RAMP Website" and "Fall RAMP Users' Meeting October 17th – 21st, 2016 – Washington D.C. Metro Area", with a blue button labeled "Register for Users' Meeting".

ATMOSPHERIC CODES DISCUSSION

Radiological Releases

1. **Design Basis Accidents - DBAs (ARCON96, PAVAN)**
 - Control Room (CR)/Technical Support Center (TSC) habitability from intake/inleakage
 - Offsite (exclusion area boundary [EAB], low population zone[LPZ])
2. **Routine Releases (XOQDOQ)**
 - Site Boundary
 - Special Receptors (nearest resident, garden, milk/meat animal)
 - Population Dose (80 km radius)
3. **Emergency Response (RASCAL)**
4. **Severe Accident Releases (MACCS - not in RAMP)**

Toxic Gas Releases (onsite and offsite)

5. **Control Room (HABIT)**

ARCON96

ARCON96 Overview

ARCON96 is a:

- Gaussian plume model
- Diffusion coefficients account for enhanced dispersion under low wind speed conditions and in building wakes
- χ/Q values are estimated for various time-averaged periods
- 0-2 hrs, 2-8 hrs, 8-24 hrs, 1-4 days, 4-30 days
- Meteorological input consists of hourly values of wind speed, wind direction, and atmospheric stability class
- Hourly meteorological data are used to calculate hourly χ/Q values
- Hourly χ/Q values are then combined to estimate concentrations ranging in duration from 2 hours to 30 days
- Cumulative frequency distributions are prepared from the average χ/Q values
- χ/Q values that are exceeded no more than 5 percent of the time for each averaging period are selected

RAMP Users' Meeting

DBA RELEASES TO THE CR AND TSC: REGULATIONS

- 10 CFR Part 50, Appendix A, General Design Criterion 19 (GDC 19), Control Room
 - Adequate radiation protection shall be provided to permit access and occupancy of the control room under accident conditions without personnel receiving radiation exposures in excess of 5 rem (0.05 Sv) whole body, or its equivalent to any part of the body, for the duration of the accident
- 10 CFR Part 50, Paragraph IV.E.8 of Appendix E, to Emergency Facilities and Equipment
 - Onsite emergency facilities be provided, from which effective direction can be given and effective control can be exercised during an emergency
 - Per SRP 15.0.3, TSC should provide the same level of protection against radiation that the control room provides

DBA RELEASES TO THE CR AND TSC: GUIDANCE

U.S. Nuclear Regulatory Commission

ARCON96: OVERVIEW

- Gaussian plume model
 - enhanced diffusion coefficients to account for dispersion under low wind speed conditions and building wakes
- χ/Q values are estimated for various time-averaged periods
 - 0-2 hrs, 2-8 hrs, 8-24 hrs, 1-4 days, 4-30 days
- Meteorological input consists of hourly values of wind speed, wind direction, and atmospheric stability class
- Calculates hourly χ/Q values
 - Hourly χ/Q values are then combined to estimate concentrations ranging in duration from 2 hours to 30 days
 - Cumulative frequency distributions are prepared from the average χ/Q values
 - χ/Q values that are exceeded no more than 5 percent of the time for each averaging period are selected

ARCON96: INPUT CONSIDERATIONS

- Meteorology
 - Hourly file of wind speed, direction, stability
 - Wind measurement heights
- Source
 - Type: ground, vent, or stack
 - Height (vent or stack release)
 - Building area (ground or vent release)
 - Vertical velocity, stack flow, and radius
- Receptor
 - Distance to receptor
 - Intake height
 - Elevation difference
 - Direction to source

ARCON96: RUNNING THE CODE

- The original ARCON96 DOS Windows executable will NOT run on 64-bit operating systems; only the ARCON96 Fortran executable (ARCON96F.EXE) can be used on these systems.
- To run ARCON96 (Window 7 and higher), systems:
 - create a properly formatted ARCON96 run specification file (.rsf) and associated hourly meteorology file
 - open a Windows Command window and navigate to the ARCON96 folder
 - type the executable name followed by the .rsf file on the command line:
 - *ARCON96F.EXE INPUT.RSF*
 - press the enter key and ARCON96 will run; the model output will be written to the user-defined output files specified in the input file.

RAMP Users' Meeting

an-overview **RAMP Users' Meeting 2016**

PAVAN Overview

The information on PAVAN code is following:

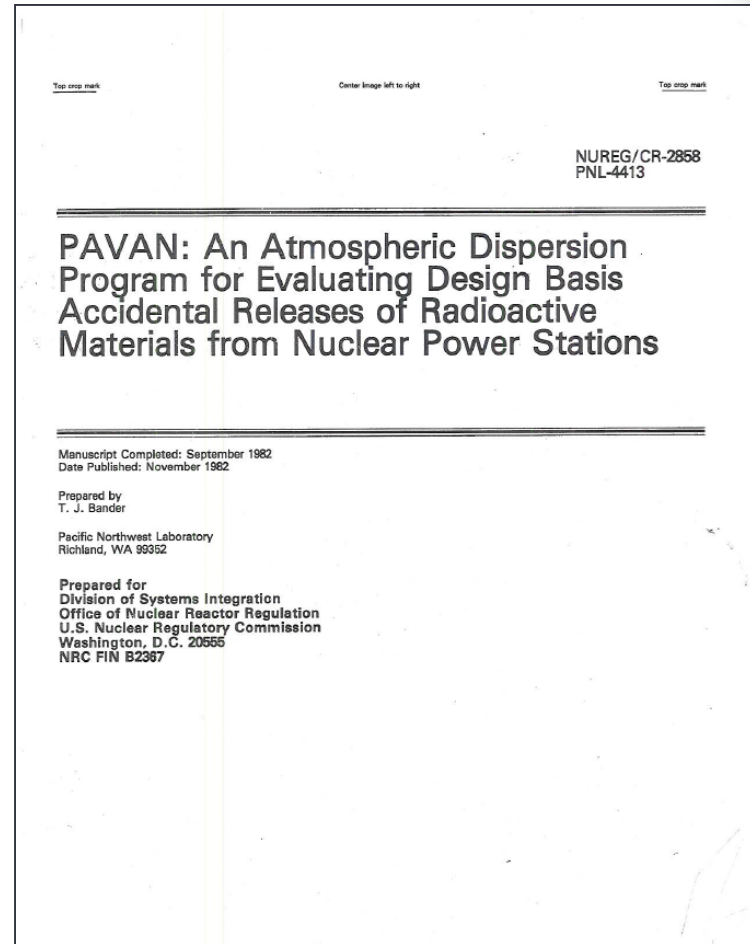

- The larger of the following two calculated χ/Q values is selected to represent the χ/Q value for the 0–2 hour time interval:
 - 0.5-percent maximum sector value
 - 5-percent overall site value
- These calculated χ/Q values are based on 1-hour averaged data but are conservatively assumed to apply for 2 hours
- This procedure is repeated two times:
 - Once for the EAB
 - Once for the LPZ
- 0.5-percent Maximum Sector χ/Q Value:
 - For each of the 16 downwind direction sectors (N, NNE, NE, ENE, etc.), χ/Q values are calculated for each combination of wind speed and atmospheric stability at the appropriate downwind distance
 - The χ/Q values calculated for each sector are then placed in order from the greatest to the smallest, and an associated cumulative frequency distribution is derived based on the frequency distribution of wind speed and stabilities for each sector.
 - An upper envelope curve is determined for each sector, based on the derived data (plotted as χ/Q versus probability of being exceeded), so that no plotted point is above the curve
 - From this upper envelope, the χ/Q value, which is equaled or exceeded 0.5 percent of the total time (44 hrs) is obtained
 - The maximum 0.5 percent χ/Q value from the 16 sectors becomes the 0–2 hour “0.5-percent maximum sector χ/Q value”
- 5-percent Overall Site χ/Q Value:
 - Using the same approach, all χ/Q values independent of wind direction are combined into one cumulative frequency

DBA RELEASES TO THE EAB AND LPZ: REGULATIONS

- 10 CFR 52.79(a)(1)(vi), Contents of applications; technical information in final safety analysis report
 - Perform an assessment assuming a fission product release from the core into the containment
 - An individual located at any point on the boundary of the EAB for any 2-hour period would not receive a dose in excess of 25 rem (0.25 Sv) TEDE
 - An individual located at any point on the outer boundary of the LPZ would not receive a dose in excess of 25 rem (0.25 Sv) TEDE during the entire period of the passage of the radioactive cloud

PAVAN: OVERVIEW

- Gaussian plume model
 - for ground-level releases, diffusion coefficients modified to account for plume meander under low wind speed conditions and building wakes
- Estimates χ/Q values for various time-averaged periods
 - 0-2 hrs and annual average
 - 0-8 hrs, 8-24 hrs, 1-4 days, 4-30 days are determined through logarithmic interpolation of the 0-2 hrs and annual average values
- Meteorological input consists of a joint frequency distribution (JFD):
 - wind speed (calms defined as below sensor threshold, historically ~ 1 mph)
 - wind direction (16 directions, 22.5 deg sectors, centered on true north)
 - atmospheric stability class A-G (preferably based on delta-T)
- Building wake impacts on release height
 - release points < 2.5 times the height of adjacent solid structures \rightarrow ground-level releases
 - release points > 2.5 times the height of adjacent solid structures \rightarrow elevated (stack) releases
- Part-time fumigation conditions assumed for stack releases

PAVAN: INPUT CONSIDERATIONS

- The release mode can be ground-level or elevated
- Ground-level releases can have additional dispersion due to:
 - plume meander, and/or
 - entrainment into the wake of building structures
- For elevated releases, terrain height can be incorporated into a calculation of “effective plume height”
- Plume diffusion can be described by:
 - Pasquill-Gifford
 - Desert curves (Markee)
- Site-specific or default correction factors to account for non-straight trajectories may be used in the calculation of the annual average χ/Q values

PAVAN: RUNNING THE CODE

- PAVAN is run using a Fortran executable called “PAVAN.exe”
- To run PAVAN:
 - create a properly formatted PAVAN input file per NUREG/CR-2858, which includes the JFD
 - open a Windows Command window and navigate to the PAVAN folder
 - type the executable name followed by the input and output file on the command line:
 - *PAVAN.EXE INPUT.TXT > OUTPUT.TXT*
 - press the enter key and PAVAN will run; the model output will be written to the user-defined output file

XOQDOQ
PAVAN
ARCON96

XOQDOQ Overview

XOQDOQ is a:

- Gaussian plume model:
 - Plume horizontal distribution is assumed to be evenly distributed within the 22.5 deg downwind sector (sector-averaging)
 - For ground-level releases, plume vertical diffusion coefficient modified to account for building wake
- Meteorological input consists of a JFD of hourly values of:
 - Wind speed (calms defined as 1/2 sensor threshold)
 - Wind direction (16 directions, 22.5 deg sectors, centered on true north)
 - Atmospheric stability class (preferably based on delta-T)
- Building wake impacts on release height:
 - Release points below adjacent solid structures → ground-level releases
 - Release points higher than but less than 2 times higher than adjacent solid structures → mixed-mode (part-time ground, part-time elevated) releases
 - Function of the ratio of plume vertical exit velocity to horizontal wind speed
 - Release points higher than 2 times adjacent solid structures → elevated releases
 - Calculates effective plume height
- Allows adjustment of χ/Q and D/Q values to account for the effects of local air recirculation or stagnation using default or

ROUTINE RELEASES: REGULATIONS

- 10 CFR Part 20, Subpart D, Radiation Dose Limits for Individual Members of the Public
 - The *annual* average concentrations of radioactive material released in gaseous effluents at the boundary of the unrestricted area do not exceed the values specified in Table 2 of Appendix B to Part 20
 - Intended to result in doses below 0.05 rem (0.5 mSv)
- 10 CFR Part 50, Appendix I, Numerical Guides for Design Objectives and Limiting Conditions for Operation to Meet ALARA Criterion for Radioactive Material in Reactor Effluents
 - Section II.B: Unrestricted *annual* air dose < 10 mrad (0.1 mGy) gamma or 20 mrad (0.2 mGy) beta
 - Section II.C: Unrestricted *annual* individual organ dose from all pathways of exposure < 15 mrem (0.15 mSv)
 - Section II.D: radwaste system cost-benefit analysis based on population dose out to 50 miles

ROUTINE RELEASES: GUIDANCE

XOQDOQ: Computer Program for the Meteorological Evaluation of Routine Effluent Releases at Nuclear Power Stations

Final Report

Draft Report Published as NUREG-0324

Prepared by J. F. Sagendorf, J. T. Goll, W. F. Sandusky

Pacific Northwest Laboratory
Operated by
Battelle Memorial Institute

Prepared for
U.S. Nuclear Regulatory
Commission

XOQDOQ: OVERVIEW

- Gaussian plume model
 - plume horizontal distribution is assumed to be evenly distributed within the 22.5 degree downwind sector (sector-averaging)
 - for ground-level releases, plume vertical diffusion coefficient modified to account for building wake
- Meteorological input consists of a JFD of hourly values of:
 - wind speed (calms defined as $\frac{1}{2}$ sensor threshold)
 - wind direction (16 directions, 22.5 degree sectors, centered on true north)
 - atmospheric stability class (preferably based on delta-T)
- Building wake impacts on release height
 - release points below adjacent solid structures → ground-level releases
 - release points at, but less than 2 times higher than adjacent solid structures → mixed-mode (part-time ground, part-time elevated) releases
 - function of the ratio of plume vertical exit velocity to horizontal wind speed
 - release points higher than 2 times adjacent solid structures → elevated releases
 - calculates effective plume height
- Allows adjustment of χ/Q and D/Q values to account for the effects of local air recirculation or stagnation using default or user-supplied site-specific correction factors

XOQDOQ: OVERVIEW (CONT'D)

- Dry depletion/deposition
- Annual estimates of χ/Q and D/Q values
 - No Decay/Undepleted χ/Q values: used to evaluate ground level concentrations of long lived noble gases (e.g., tritium and C-14)
 - 2.26-Day Decay/Undepleted χ/Q values: used to evaluate ground-level concentrations of short-lived noble gases (based on half-life of Xe-133m)
 - 8.00-Day Decay/Depleted χ/Q values: used to evaluate ground level concentrations of radioiodine and particulates assuming dry deposition (based on the half-life of I-131)
 - No Decay D/Q values
- Receptor locations
 - plant boundary
 - nearest resident, milk and meat animal, and vegetable garden
 - 22 standard radial distances out to 50 miles
 - 10 standard distance-segments out to 50 miles

XOQDOQ: INPUT CONSIDERATIONS

- Sources
 - Elevated
 - can include plume rise from momentum/buoyancy
 - can include topography for use in “effective height” calculation
 - Ground-level
 - can include additional dispersion from building wakes
 - Mixed-mode
 - vents at or above height of adjacent structures
- Meteorology
 - joint frequency distribution of wind direction (16 sectors), wind speed (up to 14 bins), stability class (7 classes, A through G)
 - diffusion: Pasquill-Gifford (P-G) or desert curves (Markee)
 - wind speed extrapolation to release height
- Plume decay for varied half-lives
- Plume depletion from dry deposition
- χ/Q modified for recirculation or air stagnation

XOQDOQ: RUNNING THE CODE

- XOQDOQ is run using a Fortran executable called “XOQDOQ.exe”
- To run XOQDOQ:
 - create a properly formatted XOQDOQ input file per NUREG/CR-2919, which includes the JFD
 - open a Windows Command window and navigate to the XOQDOQ folder
 - type the executable name followed by the input and output file on the command line:
 - *XOQDOQ.EXE INPUT.TXT > OUTPUT.TXT*
 - press the enter key and XOQDOQ will run; the model output will be written to the user-defined output file
- XOQDOQ output can be used in GASPAR or GENII to estimate individual and population doses.

QUESTIONS?

- *Jeremy Rishel*
 - *Mr. Rishel support the RAMP Atmospheric Codes, including ARCON96, PAVAN, and XOQDOQ. In addition, Mr. Rishel supports the development of the NRC's RASCAL emergency response code.*
